SUNWAY UNIVERSITY · IT PROJECT

PantryPal

Know what to sell first, before it spoils.

Smart stock alerts for small food businesses

THE PROBLEM

Small food shops guess what to sell first

Expiry goes unnoticed

Batches hide in the back until the date has passed.

Discounts come late

By the time a sale is decided, little time is left to sell.

Over-ordering repeats

The same items are re-stocked and wasted again.

THE SOLUTION

PantryPal tells you what to do, and how many RM are at risk

Discount

Which items to mark down, and by what percentage.

Sell first

Which batches are closest to expiring.

Order less

Where past sales show you are over-stocking.

HOW IT WORKS

From sales file to action in three steps

1

Import sales

Upload the POS export. A preview checks every row before anything is saved.

2

Engine predicts

Our model estimates the spoilage risk and expected waste for each batch.

3

App recommends

Each batch gets an action, a discount and the RM it could save.

LIVE DEMO · TODAY'S ALERTS

One glance shows the day's risk

5
Expired or expiring today

5
Due within 3 days

RM 2,484
Stock value at risk

Demo store data, dated Thu 20 Jun 2024. Figures come from our API output.

EVERY ALERT HAS AN ACTION

Four clear next steps, with a reason

Discount

Mark down by the suggested percentage.

Monitor

Watch it. A discount does not pay off yet.

Donate

Give away what is still safe to eat.

Remove

Take it off the shelf and log the waste.

THE RESULT

+RM 616

estimated extra value per store, per week.

Result from our engine on the demo store. [Add dataset size and comparison baseline]
