PANTRY PAL

by Hackity (Team 37)

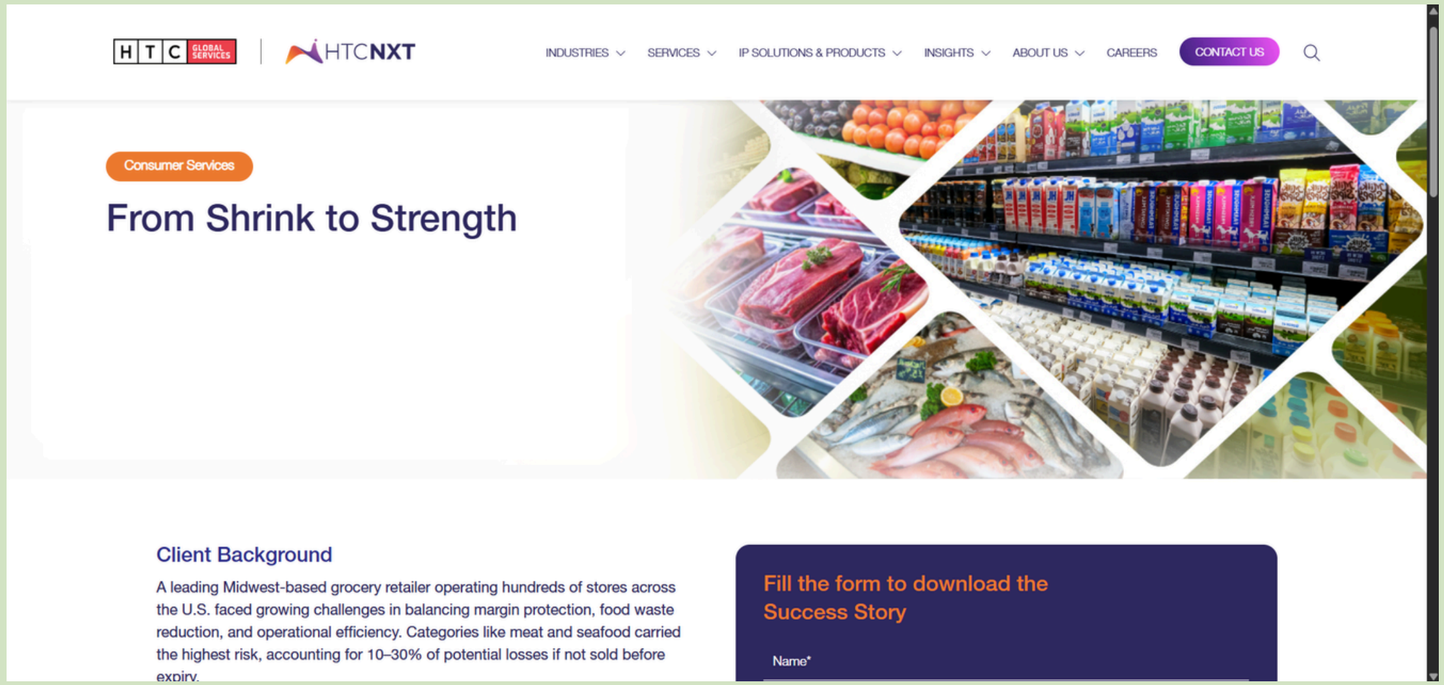

Know what to sell first, before it spoils.

VENDOR CASE STUDY

HTC Global Services helped an anonymous grocery chain in the US.

- Stock tracked quantities, not expiry dates.
- Markdowns came late, so few customers bought.
- Managers relied on judgement, not rules.

THE PROBLEM

Small food shops guess what to sell first.

- **Expiry goes unnoticed:** Batches hide in the back until the expiry date has passed.
- **Discounts come late** by the time a sale is decided and little time is left to sell.
- **Over-ordering repeats:** The same items are restocked and wasted again.

PANTRY PAL

THE SOLUTION

PantryPal tells you what to do, and how much money is at risk.

- **Discount:** Which items to mark down, and by what percentage
- **Sell First:** Which batches are closest to expiring.
- **Order Less:** Where past sales show you are over-stocking

HOW IT WORKS

From sales file to action in three steps

1. Import Sales

Upload the Point of Sale (POST) export. A preview checks every now before anything is saved.

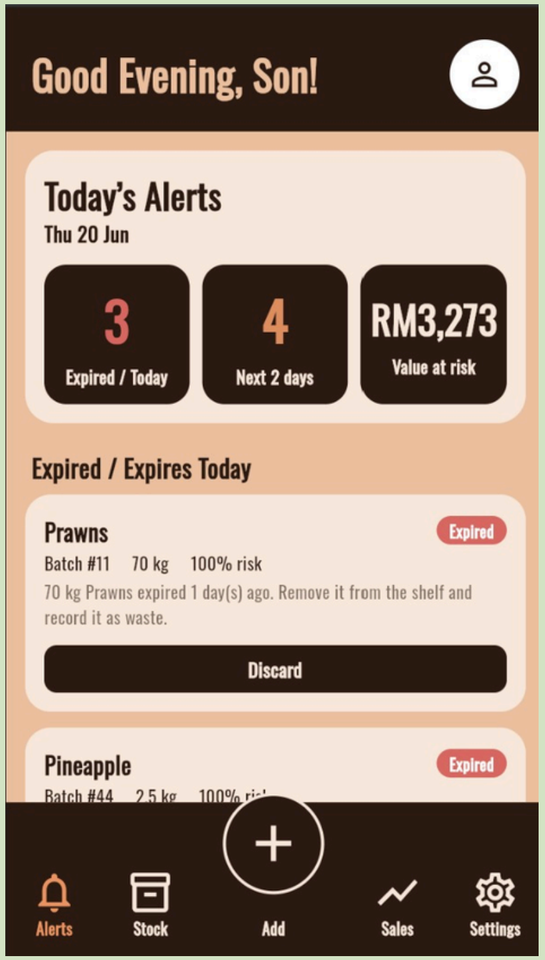

2. Engine Predicts

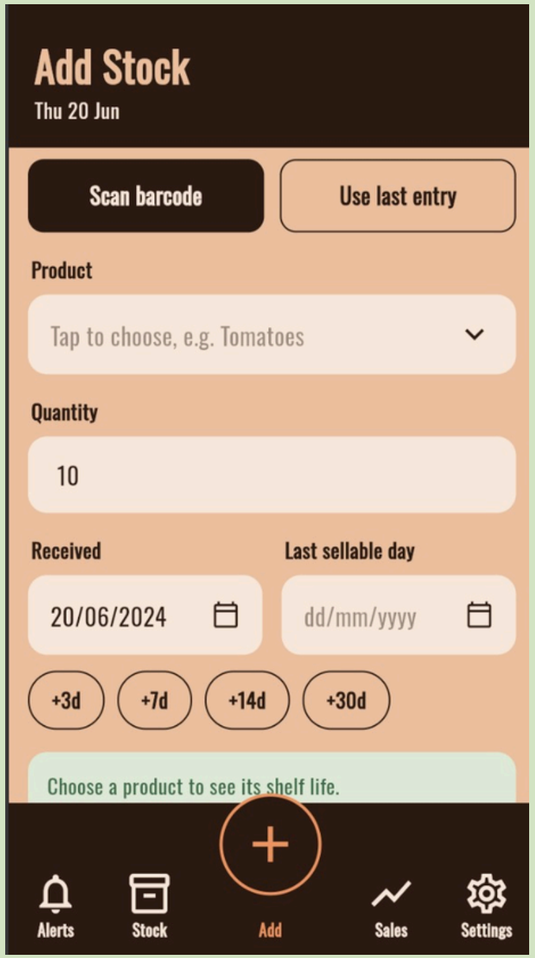

Our model estimates the spoilage risk and expected waste for each batch.

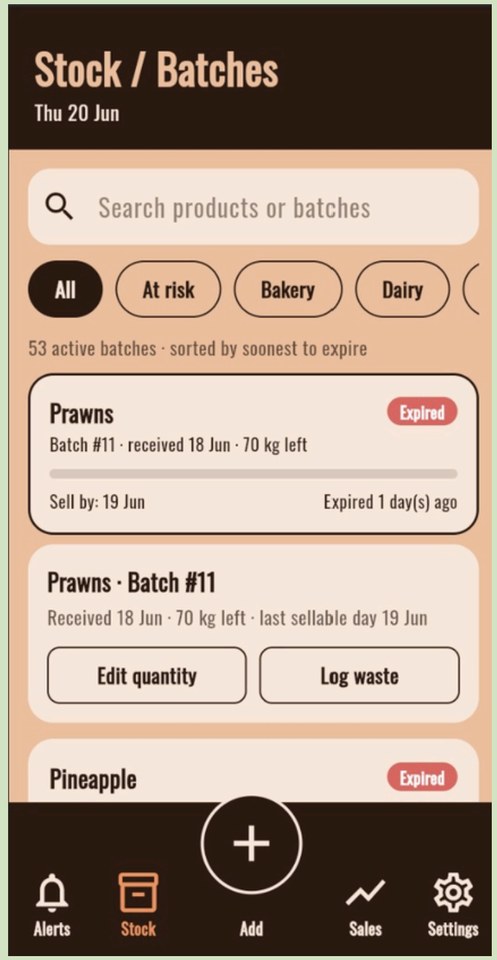

3. App Recommends

Each batch gets an action, a discount and the money it could save.

APPLICATION UI

APPLICATION UI

Sales Import

Upload your POS export

1 Upload | 2 Map | 3 Preview | 4 Done

Drop a CSV file here

Choose file | Download template

PREVIEW & VALIDATE

Choose a file to check it here. Nothing is saved until you press "Import valid rows".

IMPORT HISTORY

Imports you make appear here.
